

Re: Letter of Support for Space Exploration Holdings, LLC
ICFS File No. SAT-LOA-20260108-00016
Application for Authority to Launch and Operate the SpaceX Orbital Data Center System

February 6, 2026

Office of the Secretary
Federal Communications Commission
45 L Street NE
Washington, D.C. 20554

To the Commission,

Starcloud, Inc. (“Starcloud”) submits this letter in support of the above-referenced application filed by Space Exploration Holdings, LLC (“SpaceX”) seeking authority to launch and operate the SpaceX Orbital Data Center System (ICFS File No. SAT-LOA-20260108-00016). This application has recently progressed from submission to Public Notice within 5 days, with a shortened public notice period. Starcloud supports the Commission’s effort to fast track all applications of this nature in this manner given the importance of the topic.

Starcloud is also a recent applicant before the Commission. On February 4, 2026, Starcloud filed its own application seeking authorization to launch and operate the Starcloud Orbital Datacenter System, a satellite constellation designed primarily to provide distributed space-based computing capacity for AI models. Starcloud’s filing reflects our strong belief that orbital data centers can materially advance the public interest by expanding scalable compute capacity while reducing dependence on constrained terrestrial energy and cooling infrastructure.

Starcloud supports grant of SpaceX's application for three principal reasons:

1. Public interest benefits from scalable, space-based compute.

Orbital datacenters address the growing difficulty of scaling terrestrial data centers in a timely, cost-effective, and environmentally responsible manner. Authorizing multiple U.S.-based orbital data center systems will strengthen U.S. leadership in AI infrastructure and broaden access to advanced computing resources across industries and communities.

2. Efficient spectrum use and minimal interference risk via optical communications.

SpaceX's proposal emphasizes that its system will rely nearly exclusively on optical links, with any radiofrequency operations for TT&C in the NGSO-primary portion of the Ka-band on a non-interference, unprotected basis. Starcloud's system architecture similarly relies predominantly on optical links and backup TT&C in Ka-band on the same non-interference, unprotected basis. These design choices are highly aligned with the Commission's objectives of responsibly promoting innovative NGSO systems while protecting other authorized users.

3. Commitment to safe and sustainable operations and coordination.

Starcloud recognizes the importance of space sustainability and operational coordination in an era of rapidly increasing NGSO deployment. SpaceX's application describes a robust approach to safe operations, including orbit-raising practices, collision avoidance, and

responsible end-of-life disposal. Starcloud's own application likewise emphasizes collision avoidance, transparent coordination with other operators, and responsible disposal practices. Granting SpaceX's application will further strengthen an ecosystem where operators adopt and reinforce best practices for conjunction risk management, data sharing, and safe operational conduct. Starcloud expects to coordinate in good faith with SpaceX and other operators on deconfliction and operational safety, consistent with Commission rules and evolving industry best practices.

For these reasons, Starcloud respectfully urges the Commission to expeditiously grant SpaceX's application (ICFS File No. SAT-LOA-20260108-00016). In Starcloud's view, approval will advance the Commission's public interest mandate by enabling an important new class of space services, supporting innovation and U.S. competitiveness in AI infrastructure, and promoting efficient spectrum use and responsible orbital operations.

Respectfully submitted,

Starcloud, Inc.
